## Tiltable sample-melting furnace

The rotary drum furnace is a tiltable sample-melting furnace. It is suitable for melting scrap and also for determining the composition of the scrap. The capacity of the furnace is 1,000 kg of liquid aluminium.

### Efficient heating

Heating is carried out either with a gas-oxygen or gas-air burner, which is integrated into the oven door. The main burner is ignited by a pilot burner.

### Safe disposal of waste gas

The design provides safe waste gas extraction at all times. With the furnace door closed, emissions are sucked through an exhaust pipe on the door connected to a vacuum system. With the furnace door open, a hood mounted on the furnace prevents any fugitive emissions escaping into the building.

### Tilting, opening, closing

To empty the furnace, it is tilted. A cross plate that swings into the door opening holds back unwanted slag. Both the tilting of the furnace as well as the opening and closing of the door are carried out hydraulically. The two cylinders for this purpose are controlled by a central hydraulic unit.

### Drive, control and visualisation

A revolving chain provides the drive for the rotating drum. The control of the entire furnace is performed by a Siemens S7 controller. This enables the operator to keep a close watch on the components and the operating data, as all data such as temperature and pressure are displayed on a visualisation system.

### Advantages:

- > Perfected technology
- > Precise analysis of the scrap composition
- > Precise analysis of the aluminium content of the scrap
- > Adhering organic contaminants are burnt off

1 Rotary drum furnace with the furnace door open

2 Rotary drum furnace

3 Rotary drum furnace during casting

### An overview of our industrial furnace products:

- MultiMelter<sup>®</sup>
- EcoMelter<sup>®</sup>
- Casting furnace GO
- **Rotary drum furnace DKO**
- Charging
- Alu-Treat<sup>®</sup>
